DO YOU REMEMBER THIS?

A Dentist has a nurse who is sitting there - **sucking** the **whole day**…

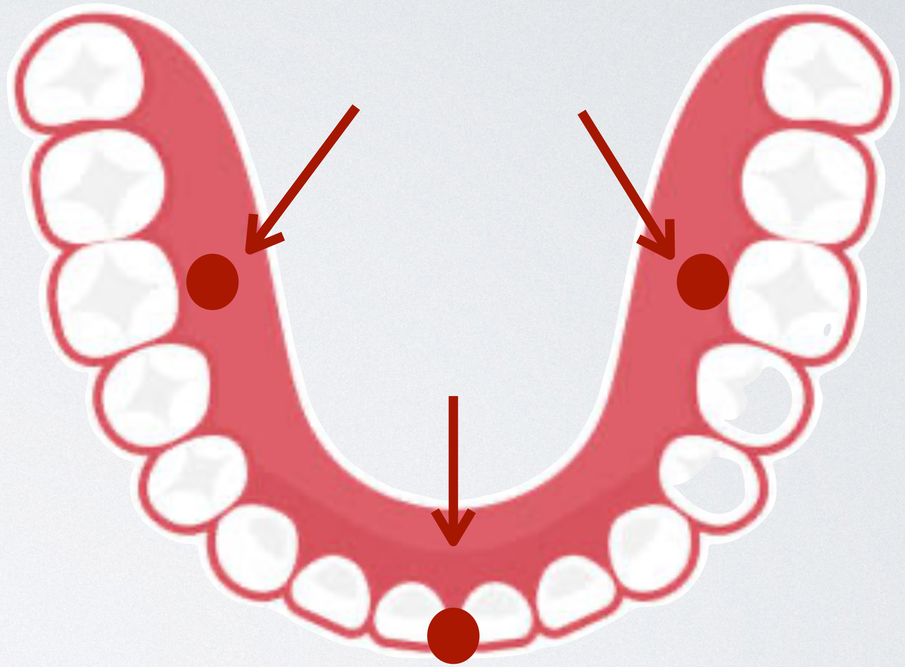

…water, saliva, blood!

How can we make the nurse's **life easier**?

Exactly! **Robots**!
Hugging Face

THE IDEA

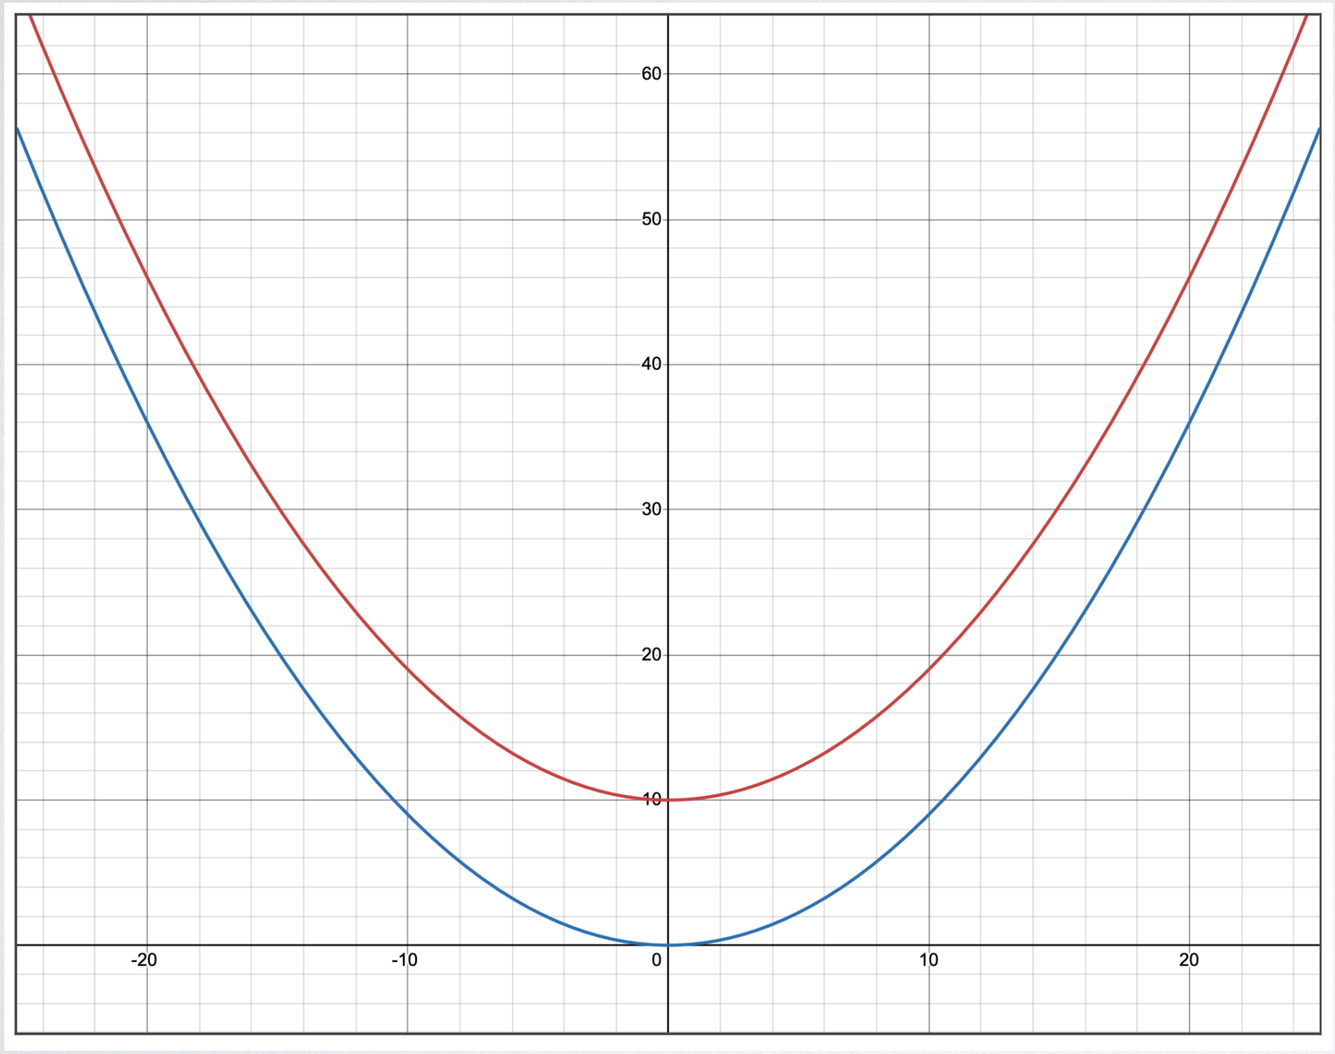

1. Dentist has a patient
2. Calibrate the robot - 3 points in 3s
3. Let the robot do the **sucking**!

Extra gadget:

- Robot is **voice-controlled** just like your the nurse

But how? Short trip through our neurons…

ax^2 + n = y

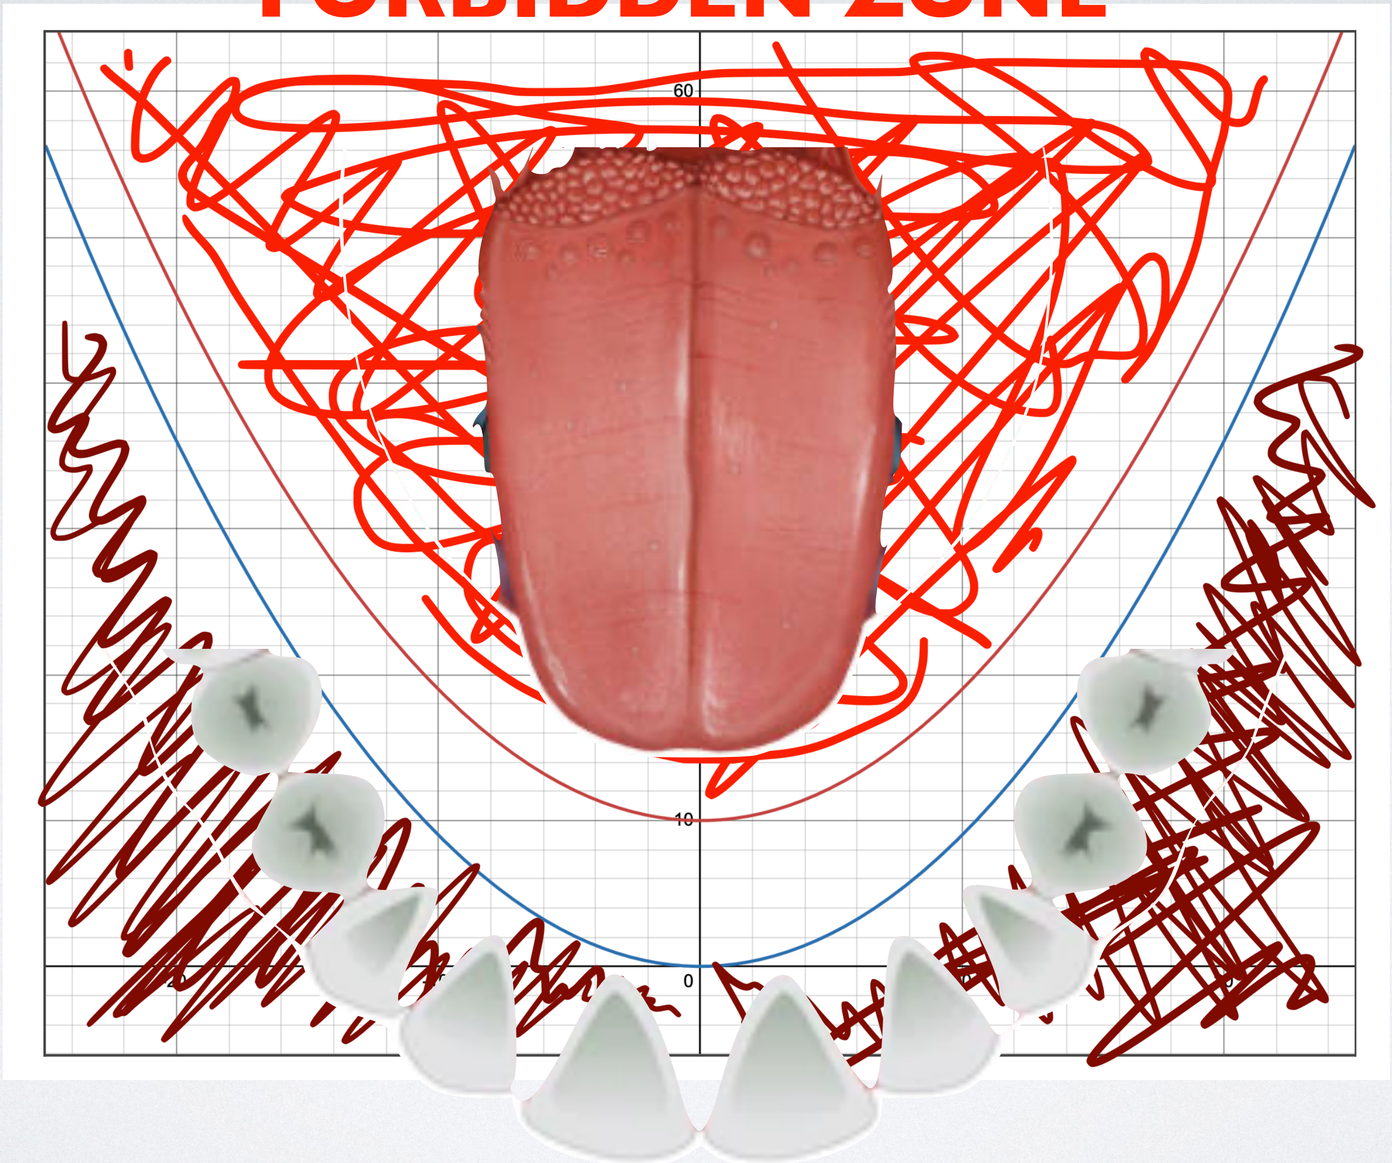

Blue graph:
0,09x^2=y
—> **Minimum trajectory** of suction in the mouth

Red graph:
0,09x^2+10mm=y
—> **Maximum trajectory** of suction in the mouth

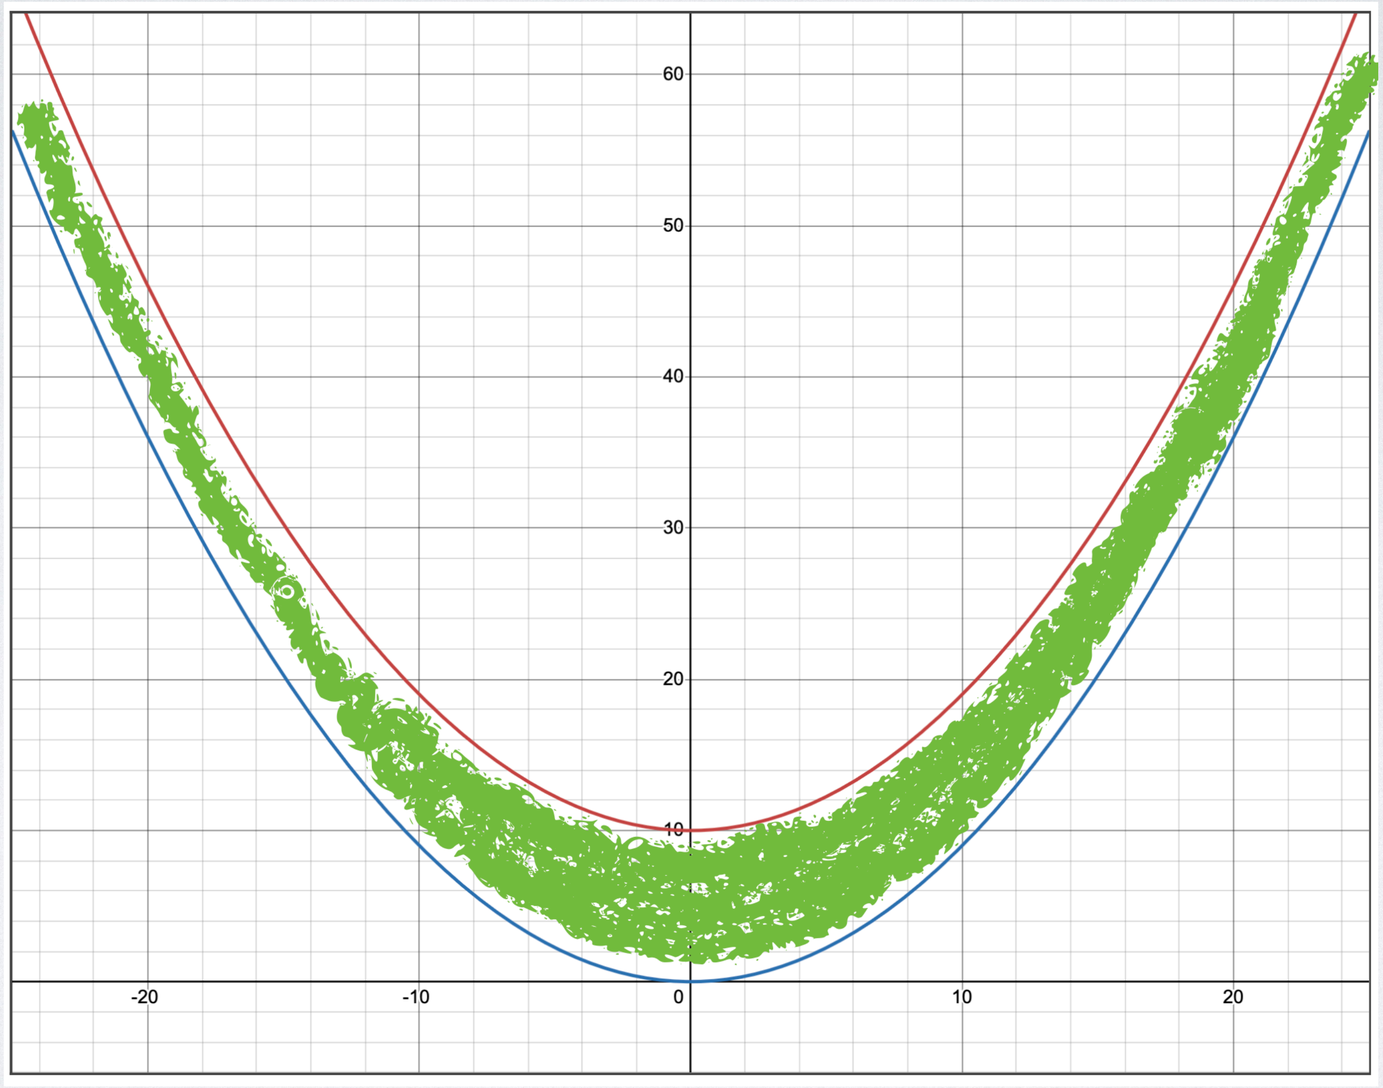

Area under the graph:
Space the suction is allowed to move for proper function

SO BASICALLY

FORBIDDEN ZONE

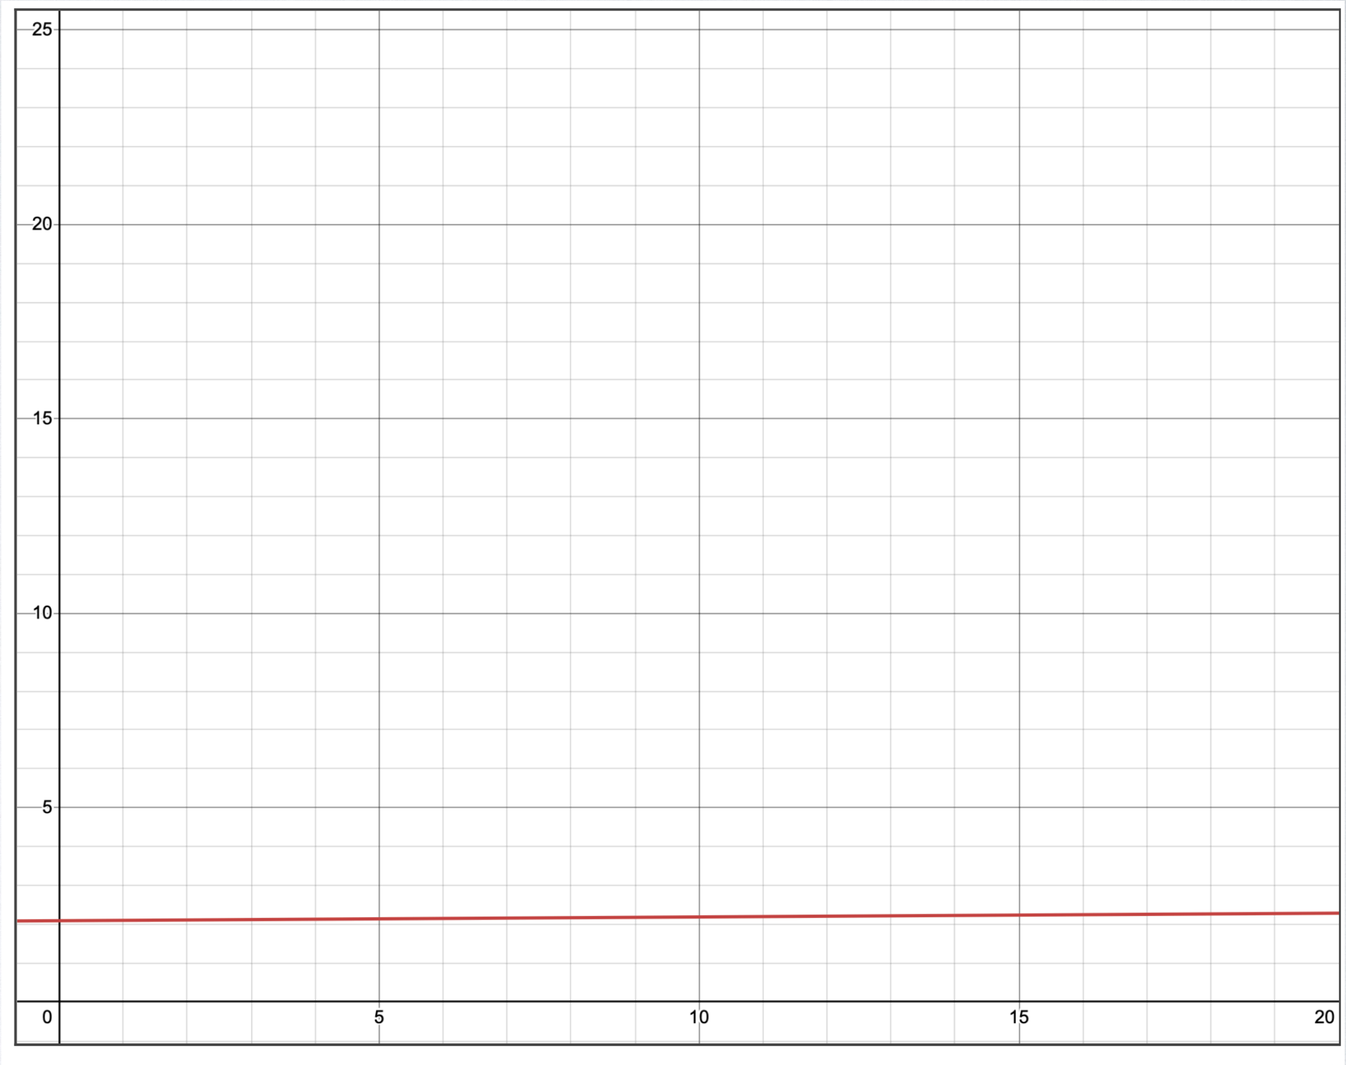

ALLOWED ZONE

Graph shows the **proportionality** of
jaw size & **depth of suction position**

$z = 0{,}0097(xy)+2{,}093$

PROS you can't ignore

- Nurse can focus on other tasks
- **Piece** and **quiet** for the dentist
- **Lower chance** of **drowning** patients
- You would **safe** around **2000-2500€** per month (e.g. 15 treatments each 20min suction use - 5 day week)

When the dentist's assistant aint doing their one job with the suction tube so you're just there like

Help us safe lives!
